### General Notes

All in Python3.

### 0 Day 0: Hello, World.

```
# Read a full line of input from stdin and save it to our
         dynamically typed variable, input_string.
inputString = input()
print (inputString)
```

### 1 Day 1: Data Types

```
i = 4
d = 4.0
s = 'HackerRank'

# Declare second integer, double, and String variables.
i2 = int(input())  # read int
d2 = float(input()) # read double
s2 = input()  # read string

# print summed and concatenated values
print(i + i2)
print(d + d2)
print(s + s2)
```

### 2 Day 2: Operators

```
mealCost = float(input())
tipPercent = int(input())
taxPercent = int(input())

tip = mealCost * (tipPercent/100.)

tax = mealCost * (taxPercent/100.)

totalCost = mealCost + tip + tax
total = round(totalCost)

print ('The total meal cost is', int(total), 'dollars.')
```

#### 3 Day 3: Intro to Conditional Statements

```
import sys

N = int(input().strip())

condition = 'Not Weird'

if N % 2 != 0:
    condition = 'Weird'

elif N % 2 == 0 and (N >= 6 and N <= 20):
    condition = 'Weird'

else:
    condition = 'Not Weird'

print(condition)</pre>
```

#### 4 Day 4: Class vs. Instance

```
, , ,
Objective:
In this challenge, we are going to learn about the difference
   between a class and an instance; because this is an Object
   Oriented concept, it is only enabled in certain languages.
   Check out the Tutorial tab for learning materials and an
   instructional video!
Task:
Write a Person class with an instance variable, age, and a
   constructor that takes an integer, initial Age, as a parameter.
   The constructor must assign initialAge to age after confirming
   the argument passed as initial Age is not negative; if a
   negative argument is passed as initial Age, the constructor
   should set age to 0 and print Age is not valid, setting age to
   0. In addition, you must write the following instance methods:
yearPasses() should increase the age instance variable by 1.
amIOld() should perform the following conditional actions:
  If age< 13 , print You are young.
  If >= 13 and age < 18, print You are a teenager.
  Otherwise, print You are old.
To help you learn by example and complete this challenge, much of
   the code is provided for you, but you''ll be writing everything
   in the future. The code that creates each instance of your
   Person class is in the main method. Dont worry if you dont
   understand it all quite yet!
class Person:
   def __init__(self,initialAge):
       # Add some more code to run some checks on initialAge
       self.age = 0
       if initialAge < 0:</pre>
           print ("Age is not valid, setting age to 0.")
       else:
           self.age = initialAge
   def amIOld(self):
       # Do some computations in here and print out the correct
           statement to the console
       if age < 13:
          print("You are young.")
       elif 13 <= age < 18:
```

```
print("You are a teenager.")
       elif age >= 18:
          print("You are old.")
   def yearPasses(self):
       # Increment the age of the person in here
       global age #NPR: don't quite undesrstand what global does
       age += 1
t = int(input())
for i in range(0, t):
   age = int(input())
   p = Person(age)
   p.amIOld()
   for j in range(0, 3):
       p.yearPasses()
   p.amIOld()
   print("")
```

#### 5 Day 5: Loops

```
Objective:
In this challenge, we are going to use loops to help us do some simple math. Check out the Tutorial tab to learn more.

Task
Given an integer, , print its first multiples. Each multiple (where ) should be printed on a new line in the form: N x i = result.

'''
import sys

N = int(input().strip())

for ii in range(1, 11):
    print (N,'x', ii ,'=', N*ii)
```

#### 6 Day 6: Let's Review

```
Task:
Given a string, S, of length N that is indexed from 0 to N-1, print
   its even-indexed and odd-indexed characters as space-separated
   strings on a single line (see the Sample below for more detail).

Note: 0 is considered to be an even index.

Sample Input:
2
Hacker
Rank

Sample Output:
Hoe akr
Rn ak
''''

for i in range(int(eval(input()))):
   s=eval(input())
   print((*["".join(s[::2]),"".join(s[1::2])]))
```

#### 7 Day 7: Arrays

```
Task: Given an array, A, of N integers, print A''s elements in
    reverse order as a single line of space-separated numbers.

http://docs.scipy.org/doc/numpy/reference/routines.array-manipulation.html
http://www.scipy-lectures.org/intro/numpy/numpy.html
''''
import sys

n = int(input().strip())
arr = [int(arr_temp) for arr_temp in input().strip().split(' ')]

# print(arr[::-1])
print(" ".join(map(str, arr[::-1])))
```

#### 8 Day 8: Dictionaries and Maps

```
, , ,
Objective:: Today, we are learning about Key-Value pair mappings
   using a Map or Dictionary data structure. Check out the
   Tutorial tab for learning materials and an instructional video!
Task:: Given N names and phone numbers, assemble a phone book that
   maps friends names to their respective phone numbers. You will
   then be given an unknown number of names to query your phone
   book for; for each name queried, print the associated entry
   from your phone book (in the form ) or if there is no entry for
Note: Your phone book should be a Dictionary/Map/HashMap data
   structure.
Sample Input:
sam 99912222
tom 11122222
harry 12299933
edward
harry
, , ,
import sys
# Read input and assemble phoneBook
n = int(input())
phoneBook = {}
for i in range(n):
   contact = input().split(' ')
   phoneBook[contact[0]] = contact[1]
# Process Queries
lines = sys.stdin.readlines()
for i in lines:
   name = i.strip()
   if name in phoneBook:
       print(name + '=' + str( phoneBook[name] ))
       print('Not found')
```

# 9 Day 9: Recursion

# 10 Day 10: Binary Numbers

## 11 Day 11: 2D Arrays

# 12 Day 12: Inheritance

## 13 Day 13: Abstract Classes

# 14 Day 14: Scope

# 15 Day 15: Linked List

# 17 Day 17: More Exceptions

# 18 Day 18: Queues and Stacks

# 19 Day 19: Interfaces

# 20 Day 20: Sorting

# 21 Day 21: Generics

# 22 Day 22: Binary Search Trees

# 24 Day 24: More Linked Lists

# 26 Day 26: Nested Logic

# 27 Day 27: Testing
